PLACE POT ON A SAUCER

Place the eco-coir block or disk in a bowl and add one cup (approx 225 ml) of lukewarm water. The eco-coir will absorb all of the water in a few minutes. Slowly introduce the moistened eco-coir into your biodegradable pot allowing the growing medium to aerate in the process. This will increase the volume of the moistened eco-coir.

Benefits of Eco-Coir

Has high water retention capacity while maintaining excellent drainage. Needs less watering and re-wets far more easily than peat moss that is hydrophobic (dislikes water)

Has high air retention capacity to promote healthy root development

Pathogen-free and resistant to bacteria, weeds, and fungal growth

Has a pH value in the range of 5.3-6.7 (peat moss with a pH of 3.5-4.5 is very acidic)

Reusable and recyclable for up to four years

Does not destroy natural eco-systems (peat moss is extracted from peat bogs that, in their undisturbed state, retain methane, a greenhouse gas that is twenty times more environmentally damaging than carbon dioxide)
